

Clifton Suspension Bridge

Above: The old gantry is lowered to a closed off footpath.

The new gantry is raised from the river.

The new gantry is fitted with floats.

ALPS were contracted to remove the old under deck access gantry and install the new gantry

The new gantry was installed first ensuring access beneath the bridge was always available. The new gantry was fitted with temporary floats and at high tide, slack water it was propelled up the river to beneath the bridge.

With the on-board Hoists & Safety ropes pre-rigged the new gantry was raised from the water to the underside of the bridge, a lift of approximately 80M

With the new gantry installed the old gantry was lowered to a closed-off footpath where it could be cut-up for removal.
