

Winscar Dam Access System

Specialist contractors required access to the sloping face of the dam wall in order to carry out essential repairs to the waterproof membrane.

Due to the nature of the work, location and environmental conditions safety was paramount. ALPS were called upon to supply and install an Engineered Access Solution that could carry specialist operatives, materials & equipment up & down the inclined face of the dam wall.

Pre-assembled suspension systems were quickly installed at service road level and the 8M long Access Platform was raised over the parapet and placed on the sloping face using lorry mounted crane.

The platform was equipped with soft foam rollers and was powered up and down at 9M/min'

Hoist and safety ropes & secondary safety devices ensured maximum protection to the users who remained attached to the Access Platform at all times.

Assisted by the Access Platform essential maintenance work to the membrane was carried out swiftly and safely by the specialist contractors.

ACCESS - LIFTING - PULLING & SAFETY
